Criticità delle strutture

A causa della mancanza di fondazioni stabili l'intera struttura presenta degli evidenti segni di cedimenti strutturali. Infatti, le pareti lignee poggiavano direttamente sul basamento di massi che, a loro volta, erano a contatto diretto con il suolo. In questo mdo anche tutte le infiltrazioni d'acqua dovute ai fenomeni di imbibizione e risalita hanno provocato squilibri importanti sulla struttura.

COPERTURE

Le infiltrazioni d'acqua sono uno dei problemi principali che vanno ad accellerare notevolmente il degrado delle strutture lignee. Le coperture, infatti, pur avendo dei sistemi di scolo delle acque meteoriche e dei rivestimenti protettivi di scandole non riescono a proteggere completamente le pareti. Di consequenza si verificano fenomeni di condensa con la conseguente proliferazione di muffe, licheni e carie.

APERTURE E INFISSI

Gli infissi sono costituiti esclusivamente da elementi incastrati fra loro. Sono quasi sempre privi di materiali isolanti, talvolta si possono trovare dei fogli di corteccia di betulla inseriti negli interstizi. Nonostante questo tentativo di protezione le infiltrazioni d'acqua sono inevitabili e causate prevalentemente da fenomeni di percolazione e dilavamento delle acque meteoriche. L'acqua permane nelle strutture lignee provocando la formazione di fungine.

■ PROGETTO DELLA SCHEDA TIPO

La schedatura su ogni singolo prospetto per ogni livello della chiesa è stata controllata individuando i tronchi comuni ai diversi livelli.

- Una volta individuato precisamente il tronco, l'analisi sullo stato di conservazione viene fatta sia esternamente che internamente ed indicata con lettere i (=interno) o e
- La parte bassa della scheda è dedicata alle prime considerazioni e ipotesi sul tipo di intervento.

TORSIONE DELLE FIBRE

Quando le fibre non sono parallele Consiste in distacchi parziali o totali all'asse del fusto ma sono avvolte con fra due anelli con soluzione di andamento elicoidale. Le fibre continuità nel tessuto. La cipollatura presentano delle interruzioni lungo i si manifesta in seguito al fenomeno margini con un pregiudizio della sua di gelo e disgelo, e solo all'inizio resistenza a sforzi assiali e a flessione. della stagionatura del tronco.

OCIPOLLATURA

· FUNGHI (muschi e licheni)

Consiste in distacchi parziali o totali Le carie sono un tipo di attacco fra due anelli con soluzione di tramite funghi. Si distinguono due continuità nel tessuto. La cipollatura si tipi di carie: carie bianca, dove manifesta in seguito al fenomeno di avviene un attacco della lignina, e gelo e disgelo e si manifesta solo carie bruna dove avviene un attacco all'inizio della stagionatura del tronco. delle cellulose.

INSETTI (cerambicidi, isotteri)

AZIONE ANTROPICA

Si fa riferimento ad insetti coleotteri La necessità di inserimento delle appartenenti fondamentalmente alle strutture metalliche della chiesa ha famiglie di lictidi, anobidi e reso necessario l'intervento su alcuni cerambicidi. Sono in grado di elementi lignei, in termini di degradare sia la lignina che la asportazioni, incisioni e forature provocando danni irreversibili.

LA MODELLAZIONE 3D METODOLOGIE A CONFRONTO

Supporto informatico: Geomagic Studio

Il primo approccio alla modellazione è stato effettuato con il programma Geomagic Studio. Questo software di reverse enginnering permette di importare porzioni di nuvola provenienti da un progetto di scansioni laser scanner, elaborarle quando sono ancora in formato nuvola di punti quindi trasformarle in una mesh poligonale per elaborare un modello globale dell'oggetto. L'elaborato finale è buono nella sua globalità ma presenta importanti lacune nei dettagli.

disturbo, che potrebbero interferire l'operazione di triangolazione.

parametri che modificano rugosità e levigatezza delle superfici.

Dopo aver importato le porzioni di nuvola si eliminano tutti i punti di Dopo aver effettuato la trasformazione in mesh, si regolano i Le parti nelle quali non si ha alcun riempimento vengono ricostruite attraverso la creazione di mesh.
